Compiler design lab

Assessment – 2

L45+L46

Professor: Sureshkumar WI

Harish Thangaraj

21BRS1033

I affirm that all the work presented against this assignment is done by me with limited Internet reference and can be tested on the logic and concepts if necessary .

Experiment – 1: To identify tokens from a simple expression stored in the form of a linear array.

Algorithm:

1. Import the necessary header files.
2. Predefine max tokens and max length of each token as macros.
3. Define a function to classify tokens taking token array as the argument.
 - a. Validate each index for keywords, constants, operators, identifiers and return respective types.
4. Define a function to identify tokens from the given statement and store them in an array
5. Under the main function, initialize arrays for statement, tokens, and types.
6. Take input for statement from the user.
7. Call the above functions to classify, identify and return tokens as output.
